ТЕХНИЧКИ ОПИС

ТЕХНИЧКИ ОПИС

1. УВОД

Деоница пруге Нови Сад-Суботица-државна граница (Келебија) представља трећу деоницу пруге Београд-Суботица-државна граница (Келебија).

На новој траси двоколосечне пруге Нови Сад - Суботица (мађарска граница), пројектованој за брзину од 200 km/h, уместо постојећег путног прелаза у нивоу, пројектован је нови друмски надвожњак на стационажи пруге км 102+309.98, десног колосека.

У пројектном задатку није дефинисана класа значаја за мостове. Пројектант је усвојио следеће: класу објекта II, то јест коефицијент значаја 1,0 за друмске мостове.

2. САОБРАЋАЈНИ УСЛОВИ

Надвожњак је предвиђен за двосмерни саобраћај где сваки смер има по једну коловозну траку ширине 3.25m и једну службену стазу. Осовина објекта је облика „S“ кривине. Пешачке (сервисне) стазе су ширине 0.75m лево и 2.0m десно. Попречни нагиб пешачких стаза је ка коловозу и износи 4%. Укупна ширина објекта је 11.15m. Нивелета моста од S1 до S7 је у подужном паду 4%, а од S7 до S13 у вертикалној кривини од 1250. Попречни пад коловоза износи 4,0% на почетку моста до -3.0% на крају моста

Укрштање левог колосека пруге и надвожњака је на стационажи км. 102+309.98.

3. ДИСПОЗИЦИЈА МОСТА

Надвожњак се уклапа у геометрију пута и прелази преко двоколосечне пруге, што диктира положај и оријентацију стубова, као и распоне објекта.

Надвожњак се састоји из две дилатационе целине. Прва је од стуба S1 –S7, друга од S7-S13.

Прва и друга дилатациона средина се састоје од шест поља (17,10 + 5 x 22,10m + 5 x 22,10 + 17,10)

Укупнадужина надвожњака са свим дилатационим целинамаизноси 256.20 m.

Карактеристични попречни пресек надвожњака

Укупна ширина распонске конструкције је 11.15 m и састоји се од:

• Размак од ограде до спољње ивице	2 x 0.25 = 0.50 m
• Сервисна стаза	0.75+2.0 = 2.75 m
• Еластистична одбојна ограда	2 x 0.50 = 1.00 m
• Сигурносни простор до ограде	2 x 0.20 = 0.40 m
• Коловоз	2 x 3.25 = 6.50 m
Укупно:	11.15 m

4. ОПИС КОНСТРУКЦИЈЕ

Конструктивни елементи

Надвожњак се састоји од две полуинтегралне конструкције.

Распонска конструкција је пуна плоча са конзолама на крајевима и изводи се на лицу места на скели и оплати. На овом делу објекат се налази у значајној кривини и употреба монтажних носача није практична. Са друге стране на овом делу висина објекта изнад терена није велика па је самим тим и израда скеле једноставна. Због малих распона предвиђена је армиранобетонска преднапегнута конструкција.

Стуб S7 је заједнички стуб дилатационих целина. На њему су предвиђена лежишта а конструкције су раздвојене дилатацијама.

Потпорна конструкција

Средњи стубови се састоје од два правоугаона стуба дебљине 80cm и ширине 160cm, на међусобном размаку од 3.40m. Ослањање средњих стубова је извршено преко темељне греде димензија 1.80m x 1.80m, дужине 9.20m.

Обални стубови се састоје од зида опорца дебљине 100 cm, ослоњен на темељну плочу дебљине 1.20м и 6 шипова Ф120 cm. Са горњом конструкцијом је повезан лежиштем.

На оба обална стуба су прикључене прелазне плоче дебљине 25 cm и типске дужине 3,70+2.50 = 6.20 m.

Фундирање

Обзиром на геолошки састав и носивост тла, на присуство подземне воде, а у сагласности са геолошко геотехничким елаборатом, извршено је дубоко фундирање, а усвојену коту фундирања шипова треба да потврди геотехничар приликом ископа. Усвојено је фундирање на бушеним шиповима Ø120 cm.

Фундирање је предвиђено на шиповима дужине 20m.

На средњим стубовима предвиђена су три шипа у једном реду на међусобном размаку од 3.60m і дужине 20.0 m.

На заједничком стубу (S7) предвиђено је три шипа у два реда, што чини укупно шест шипова дужине 20.0 m.

На обалним стубовима предвиђено је три шипа у два реда дужине 20.0m. Шипови су на размаку од 4.0m.

Обзиром на састав тла, шипови ће носити и по бази и по омотачу. Дубина и број шипова је димензионисан тако да максимална сила у шипу буде мања од срачунате носивости шипа.

Испод темељних греда и плоча је предвиђен слој за изравнање од 10 cm, од неармираног бетона C12/15.

Наглавне греде шипова и темељи се затрпавају водонепропусним материјалом, а клин иза крајњих стубова се изводи од шљунковите мешавине, погодне за дренирање подземне воде, набијањем у слојевима од по 30 cm.

Распонска конструкција

Распонска конструкција је пуна плоча дебљине 110 cm. На крајевима су конзоле промењиве дебљине од 45 cm на укљештењу до 22 cm на крајевима. Дужине конзола су по 2.10 m и 3,10 m, што заједно са плочом даје укупну ширину од 10.45 m. Плоча је преднапрегнута конструкција. На средњим стубовима је крута веза док је на заједничким и обалним стубовима ослоњена преко лежишта.

Статички систем

Статички прорачун је спроведен за обе дилатационе целине.

У подужном смислу надвожњак је полуинтегрална конструкција на шест распона.

Хоризонталне силе од сеизмике, силе кочења, температуре, скупљања и течења у правцу подужне осе моста примају сви средњи стубови, док обални и заједнички стуб не примају те утицаје.

Хоризонталне силе од сеизмике и ветра у попречном правцу примају сви стубови.

Елементи коловоза

На припремљену бетонску површину, која је претходно очишћена пескарењем и отпрашивањем путем компресора, наноси се хидроизолација. Преко хидроизолације се наноси коловозни застор.

Коловозна конструкција се састоји из два слоја асфалта. Први, заштитни слој дебљине 3.0cm, је асфалтбетон AB 11S, други хабајући, је асфалтбетон SMA 0/11 дебљине 4.0cm.

Ивичњаци су димензија 20 x 25 cm, висине изнад коловоза 10cm. Ивичњаци се до 0 cm на делу рампи висински прилагођавају попречном профилу трасе аутопута.

Службена стаза је армирано-бетонска, са храпавом горњом површином. Од дејства мраза и соли штити се вишеструким заштитним премазом, отпорним наUV зраке, са могућностима премошћавања пукотина и на температурама испод 0°C, отпорним на дифузију CO_2, водонепропусним, високе отпорности на старење и високе отпорности на хабање и хемијски агресивне утицаје.

Све бетонске површине у додиру са земљом премазују се са два битуменска премаза.

Опрема

Пројектом је предвиђена еластомерна дилатација над заједничким стубом капацитета померања ± 170mm, а над обалним стубовима ±85.

Над заједничким стубом предиђена су по четири лончаста лежишта, подужно померљива.

Еластична одбојна ограда треба да задовољи одредбе прописа EN 1317. На мосту је предвиђена пешачка заштитна ограда са округлим профилима и вертикалном испуном, од поцинкованог челика, висине 110 cm и окцима ширине мање од 12 cm.

На централном распону, изнад пруге, предвиђена је заштитна мрежа.

За пролаз комуналних и других евентуалних водова предвиђене су PVC цеви одговарајућег пречника, које су уграђене у бетон сервисних стаза, а предвиђени су и ревизиони шахтови са челичним поклопцем који служе за контролу инсталација које су уграђене у сервисне стазе.

Сливници на мосту су цевима повезани у затворени систем за одводњавање и испуштају атмосферску воду у кишну канализацију којом иду у систем за пречишћавање. Сливник мора да има одтицајно корито преко кога је могуће наставити хидроизолацију и усмерити процедну воду у сливник.

Бетонске прилазне рампе просечне дебљине 25 cm су армиране конструктивно и обликом се прилагођавају промени висине ивичњака и положају каналета.

Материјали

Пројектом је предвиђено уграђивање бетона следећих карактеристика:

KARAKTERISTIKE MATERIJALA / MATERIALS SPECIFICATION

ELEMENT	Beton/ concrete EN 206-1:2000	Klasa upotrebe/ Exposition class	PV	Betonski čelik/ Concrete steel	Zaštitni sloj/ Concrete cover (cm)

Бетони отпорни на мраз и со морају бити припремљени са одговарајућим системом увучених ваздушних пора (додатак аеранта), ниским водоцементним фактором (са суперпластификатором на бази поликарбоксилата), агрегатом ниске потребе за водом и коефицијентом термичке дилатације компатибилномKTD-у цементног камена, правилно уграђени и неговани, са што већим процентом довршене хидратације пре излагања смрзавању. Речни агрегат са претежно кварцним минералима има коефицијент термичке

дилатације приближан КТД-у цементне масе. Бетон носача не сме имати састојке који поспешују корозију ужади за преднапрезање.

Армирање се изводи арматуром B500B, док се преднапрезање изводи ужадима пречника Ø15.7mm, квалитета 1670/1860 MPa са ниском релаксацијом (мах 2,5% након 1000 h).

Квалитет уграђеног материјала мора одговарати важећим стандардима и пре уграђивања морају се приложити докази о квалитету материјала, без којих не сме почети уградња.

5. ТЕХНОЛОГИЈА ГРАДЊЕ

Ископ за темеље стубова и наглавне греде шипова се изводи плитко, машинским ископом темељних јама без посебне заштите. За извођење бушених шипова на осталим стубовима треба обезбедити приступ гарнитуре за бушење. Шипови се бетонирају до нивоа од мин 30 cm изнад врха шипа, с тим да на првом изведеном шипу надвишење буде мин 60 cm. При крајцовању "запрљаног" бетона чувати постављену арматуру.

После постављања слоја подложног бетона, арматуре и оплате, изводе се темељи, наглавне греде шипова и стубови, бетоном ливеним на лицу места уз потребну оплату. После ове фазе могуће је приступити делимичном затрпавању темеља и изради кегли, дренажа и засипа иза крајњих стубова.

Коловозна плоча се бетонира на лицу места уз употребу одговарајуће скеле и оплате.

На потпуно суви и неиспрскали бетон плоче поставља се прајмер и хидроизолација. Потребно је заштитити хидроизолацију моста пре других радова. По постављању ивичњака се бетонирају службене стазе и ивични венци. Следе радови на асфалтирању, постављању ограда и евентуалних инсталација.

6. ИЗМЕНЕ У ОДНОСУ НА ИДЕЈНИ ПРОЈЕКАТ

Концепт моста је задржан као у Идејном пројекту уз одређене ситне измене у циљу усаглашавања пројекта са технологијом извођача, као и оптимизације решења.

1. Промењен је карактеристични пресек моста. За пресек је усвојена преднапрегнута АВ плоча уместо ошупљене преднапрегнуте АВ плоче.
2. Места дилатација су промењена тј. промење су дужине дилатацијских секција.
3. Марка бетона распонсек конструкције је смањена са С40/50 на С35/45.
4. У главном пројекту су лежишта пројектована само на местима обалних и дилатацијских стубова. У идејном пројекту лежишта су била предвиђена на по још једном стубном месту до обалних и дилатацијских.
5. Средњи стубови дилатацијских целина су ослоњени на наглавицу на једном реду шипова у односу на идејни пројекат где су средњи стубови ослоњени на по два реда шипова.

На овај начин пројекат је усаглашен са технологијом извођача и при томе добијена поузданија конструкција једноставнија за одржавање.+

INTRODUCTION

1. УВОД / INTRODUCTION

Надвожњак се састоји од две независне дилатационе целине. Обе дилатационе целине су истог попречног пресека у виду пуне бетонске армиране плоче. Распонска конструкција једне целине је преко шест поља, осовинских распона: 17.10 + 4 x 22.10 + 21.10 = 126.60 m. Статички систем моста је континуални носач са крутим везама на свим средњим ослонцима и лежиштима на крајњим.

The superstructure consists of a two separate units. Both units have the same cross section in the form of reinforced concrete slab. The construction of one unit is over six spans: 17.10 + 4 x 22.10 + 21.10 = 126.60 m. The static bridge system is a continuous girder with rigid connections on all middle supports and bearings on the end supports.

Статички модел и анализа конструкције је урађена са програмским пакетом RM Bridge Advanced V10, тако што је главни носач у подужном смеру моделиран уз следеће елементе: beam (штапови), tendon (каблови), spring elements (везе).

The structure was analyzed using RM Bridge Advanced V10; finite element modeling software specialized for the design of bridges. In the longitudinal direction, the girder is modeled in combination with beam elements (frames), tendons (cables) and spring elements (connections).

У улазним подацима су дефинисана сва оптерећења, која су задата на моделу. Иза тога су дефинисане комбинације оптерећења.

All loads assigned to the structural model were defined as part of the input stage, followed by load combinations.

SW-STG1 **Сопствена тежина конструкције** / Self-weight of the structure

PT-STG1 **Преднапрезање каблова** / Post tensioned tendons

SDL **Додатно стално оптерећење** / Superimposed dead load

CS-STG1 **Скупљање и течење конструкције /** Creep and shrinkage, **t=60 дана**
CS-INF **Скупљање и течење конструкције** / Creep and shrinkage, **t=10000 дана**
CS-SUM **Финално оптерећење од скупљања и течења** / Summation of creep and shrinkage, **t=10060 дана**

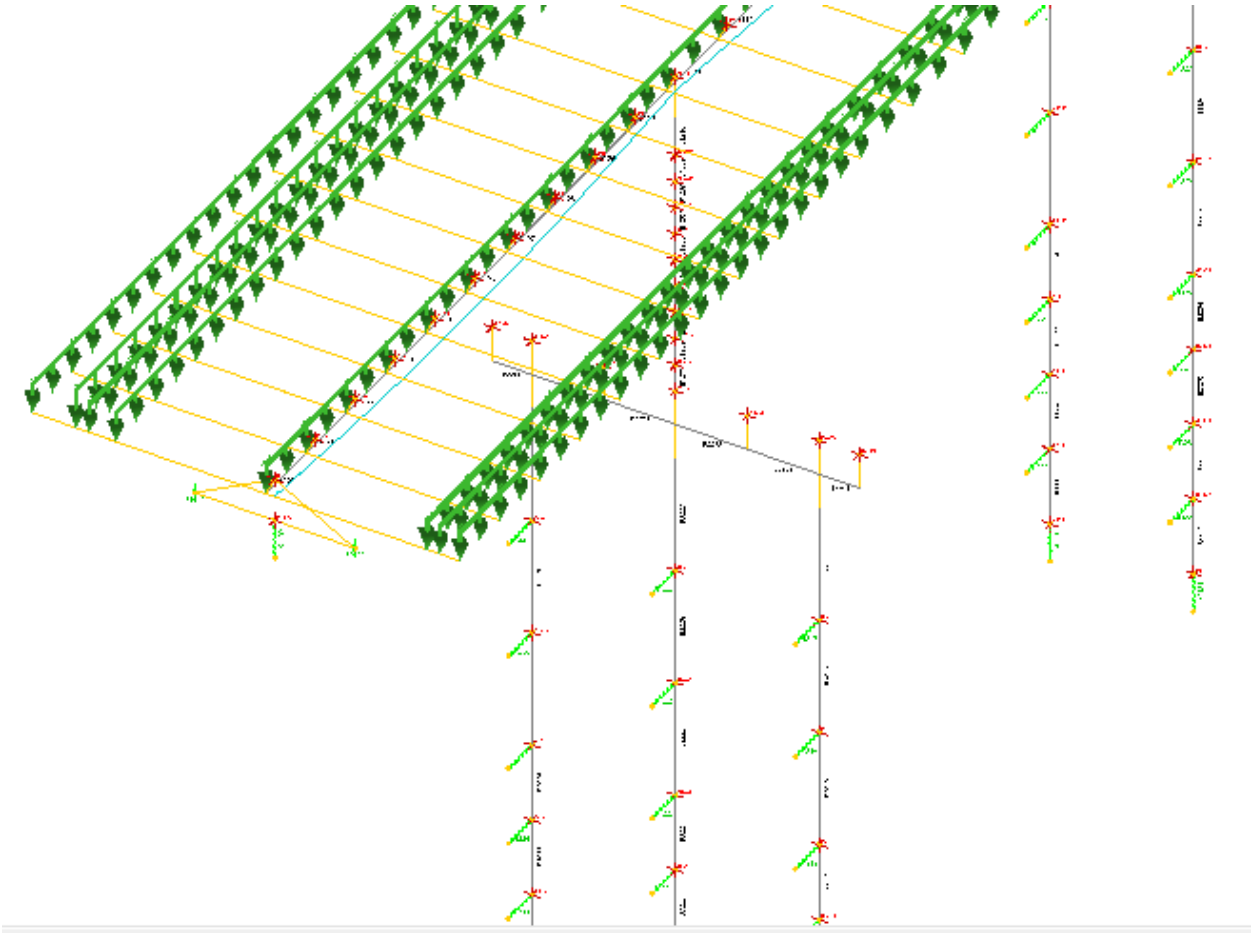
LM1-TS **Покретно оптерећење – концентрисане силе** / Moving load – concentrated loads
LM1-UDL **Покретно оптерећење – Расподељено оптерећење по тракама** / Moving load – uniforml distributed load
LM3 **Покретно оптерећење – покретно оптерећење за контролу замора** / Moving load – fatigue limit state
Brake **Покретно оптерећење – силе покретања и кочења** / Moving load – acceleration and braking forces
WindS+T.sup **Дејство ветра на мост са саобраћајним оптерећењем** / Wind load on traffic
WindS-T.sup **Дејство ветра на мост без саобраћајног оптерећења** / Wind load, without traffic
Temp-U.sup **Униформна температура** / Uniform temperature change
Temp-G.sup **Темепературни градијент** / Temperature gradient
EQ **Сеизмичко оптерећење** / Seismic (earthquake) loads

Стално оптерећење је израчунато у односу на стварну тежину појединих елемента. Запреминска тежина армираног бетона износи γ=25,0 kN/m3. Програм на основу датих запреминских тежина материјала и димензија елемената конструкције израчунава властито оптерећење.

The self-weight of the structure was calculated based on the actual weight of individual elements. The unit weight of reinforced concrete was taken as γ = 25,0 kN/m^3. Based on assigned material properties, unit weights and cross-sections, the self-weight is automatically computed by the software.

Оптерећења која се налазе на главном носачу: дебљина слојева на коловозној плочи (асфалтбетона, хидроизолације...) , сопствена тежине ограде, инсталација је дата као вертикално линијско оптерећење по дужини главних носача.

The following loads were applied to the girder: asphalt , railing etc. was applied as a vertical, uniformly distributed load along the length of the structure.



Корисна рачунска оптерећења су возила модела LM1 са комбинацијом концентрисаних сила и одговарајућим пратећим расподељеним оптерећењем. Оптерећују се две рачунске траке, са силама 300 kN, 200 kN, и силама од 100 kN у свим комбинацијама возила. Програм аутоматски узима у обзир најнеповољнији положај возила, обзиром на положај у попречном смислу који задаје корисник.

The primary moving load consists of Load Model 1 (LM1). This is a combination of a 300 kN double-axle load (referred to as the *Tandem System*) and a uniformly distributed load (referred to as the *UDL System*), applied in each traffic lane. Should there be more than one lane of traffic, the tandem system is reduced in adjacent lanes (i.e. 200 kN in lane 2, or 100 kN). Load model 3 (LM3) was considered as part of the fatigue analysis.

Реологија обухвата дуготрајне процесе скупљања и течења бетона те релаксацију каблова за преднапрезање. Коефицијент течења ϕ(t,t0) и релативне деформације скупљања єцс су узети у складу са прописима за релативну влажност околине 70%. Релаксација ужади за преднапрезање је узета програмски. Прорачун параметара реологије је у складу са редоследом и динамиком грађења и узети су у обзир програмски.

The rheology factor takes into account the creep and shrinkage of concrete, as well as relaxation of pretensioned strands. The creep coefficient $\phi(t,t_0)$ and relative shrinkage strain ε_{cs} were taken in accordance with a relative humidity of 70%. Strand relaxation properties were program-calculated. Rheology parameters were calculated in accordance with the sequence of construction, and were also applied by the program.

Температурни утицаји одређени су на основу улазних параметара: надморске висине, најмање и највеће температуре ваздуха.

Temperature loads were applied in accordance with the following input parameters: elevation above sea level, and total temperature difference between maximum and minimum.

3.2.1.2. **ГЛАВНИ МОДЕЛ ОПТЕРЕЋЕЊА (LM1)** / LOAD MODEL 1 (LM1)

Двоосовински тандем систем (TS) концентрисаних сила и једнакоподељено површинско оптерећење (UDL) / Tandem system (including two axles) (TS) and uniformly distributed load (UDL)

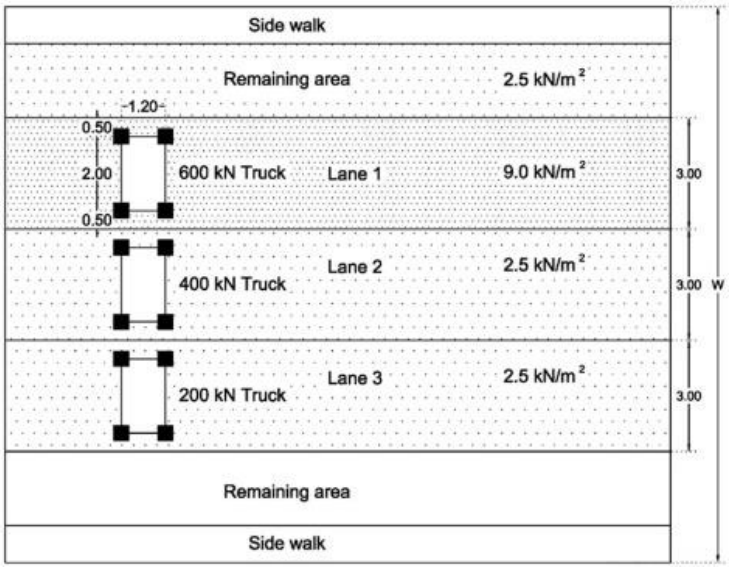
Прва трака / First lane Q_{1k} = 0.80 x 2 x 300 kN = 480 kN q_{1k}= 0.80*9.00 kN/m^2 = 7.20 kN/m^2

Друга трака / Second lane Q_{2k} = 0.80 x 2 x 200 kN = 320 kN q_{2k}= 1.0*2.50 kN/m^2 = 2.50 kN/m^2

Преостала површина / Remaining area q_{rk}= 0.5 *2.50 kN/m^2= 1.25 kN/m^2

Сервисна стаза (ширина 0.75 m) / Sidewalk (0,75 m-wide) 3.00 kN/m^2

Пешачка стаза (ширина 2.0 m) / Walkway (2,0 m-wide) 3.00 kN/m^2

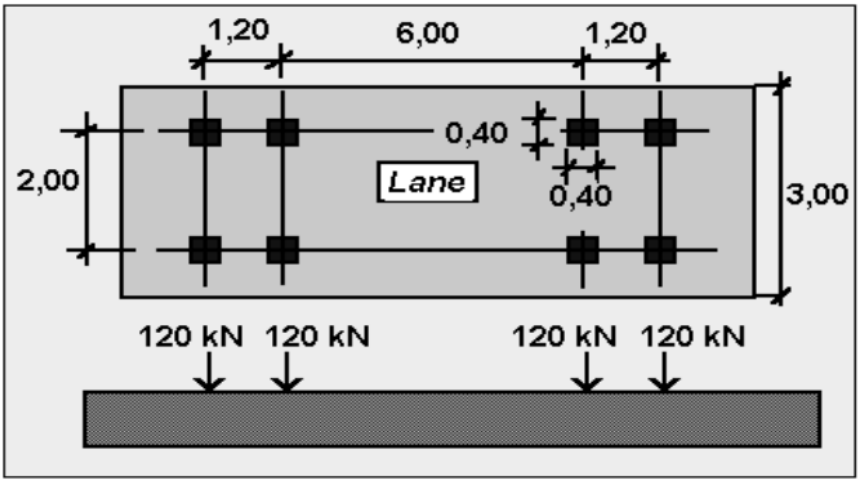


***Šema modela opterećenja 1**/ Scheme of LM1*

Двоосовински тандем систем (TS) концентрисаних сила поставља се у свакој саобраћајној траци у комбинацији са једнакоподељеним површинским оптерећењем (UDL).

A double-axle load Tandem System (TS) is applied in each traffic lane in conjunction with a uniformly distributed load system (UDL).

3.2.1.3. **МОДЕЛ ЗАМОР ОПТЕРЕЋЕЊА 3 (FLM3)** / FATIGUE LOAD MODEL (FLM3)



Срачунава се опсег напона (алгебарска разлика између минималног и максималног напона) у елементу конструкције проузрокована проласком FLM 3. Тај опсег се онда користи да се срачуна еквивалентни опсег напона, пратећи Еврокод 2 Део 2 Анекс НН.2 / Stress range (algebraic difference between maximum and minimum stress) in the element of the structure caused by FLM3 crossing the bridge is calculated. Equivalent stress ranges are calculated following Eurocode 2 Part 2 Anex NN2.

Где је потребно, два FLM3 возила се постављају у исту траку, узимајући у обзир следеће услове:

1. **Друго возило је исте конфигурације као и прво, с тим да је тежина осовине другог возила 36 kN (а не 120 kN)**
2. **Раздаљина између два возила (мерена од центра једног возила до центра другог возила) није мања од 40м.**

Two vehicles in the same lane should also be considered, with the following conditions:

Second vehicle has the same geometry as the first vehicle, but with an axle load of 36 kN, and not 120kN.

1. Distance between vehicles (measured from the center of the first vehicle to the center of the second vehicle) is not less than 40m.

- **Модели оптерећења (на замор) 1 и 2 су предвиђени за неограничени животни век услед замора и генерално се не користе (јер су превисе на страни сигурности) /** Fatigue load models 1 and 2 have been developed for infinite fatigue life and are generally not used (they are overly conservative)
- **Модели оптерећења (на замор) 4 и 5 су предвидјени за детаљнију анализу и одредјивање спектра замора (засновану на Палмгерн-Минер Закону) и нису коришћени у овом случају (није предвидјена њихова употреба по Еврокоду за овај тип конструкције) /** Fatigue load models 4 and 5 have been developed for refined analysis (based on Palmgern-Miner's Law) and are not used in this case (their use is not intended by Eurocode for these types of structure)

3.2.1.4. **СИЛЕ ПОКРЕТАЊА И КОЧЕЊА ВОЗИЛА** / ACCELERATION AND BRAKING FORCE OF VEHICLES

$180kN \cdot \alpha_{Q1} \leq Q_{lk} = 0.60 \cdot \alpha_{Q1} \cdot (2 \cdot Q_{1k}) + 0.10\, \alpha_{q1} \cdot q_{1k} \cdot wl \cdot L \leq 900\ kN$

α_{Q1}= 0.8 Q_{1k}= 300 kN
α_{q1}= 0.8 q_{1k}= 9,00 kN/m2
w_l=3.00m L1=127 m , L2=36.5 m

Q_{lk}= 0.60·0.8·(2·300)+0.1·0.8·9.00·3.00·127= 562 kN
Q_{lk}= 0.60·0.8·(2·300)+0.1·0.8·9.00·3.00·36,5= 367 kN

Усвојена вредност силе / Force to be resisted:

±562 kN (562/127 = 4.43 kN/m')
±367 kN (367/36,5 = 10,05 kN/m')

3.2.1.5. **ОПТЕРЕЋЕЊЕ НА ПЕШАЧКИМ СТАЗАМА** / PEDESTRIAN LOAD ON FOOTWAY

Карактеристично оптерећење на пешачким стазама

Characteristic pedestrian load on sidewalks

q_{fk} = 5 kPa

За прорачуне локалних елемената, потребно је анализирати и карактеристичну вредност концентрисане силе Q_{fwk} која делује на површини 10цм x 10цм на пешачкој стази

For local effects, characteristic value of concentrated load Q_{fwk}, acting on a 10 cm^2 surface on footway should also be considered.

Q_{fwk} = 10 kN

3.2.2. **УТИЦАЈИ ОД ТЕМПЕРАТУРЕ** / TEMPERATURE LOADS

ТЕМПЕРАТУРНИ УТИЦАЈИ НА ГЛАВНОМ НОСАЧУ / TEMPERATURE, SUPERSTRUCTURE
Дебљина коловоза / Surfacing (asphalt and waterproofing) thickness: 80mm

[c] Видети SRPS EN 1991-2:2012, тачка. 5.3.2.1(2). Разматра се само једна оптерећена пешачка стаза ако је то неповољније од обе оптерећене пешачке стазе.
[d] gr3 није релевантан, ако се разматра gr4.
[e] gr6 се примењује само за прорачунске ситуације које се односе на замене лежишта.

Grupe saobraćajnih opterećenja / *Traffic load groups*

Оптерећења LM3 и ЛМ4 нису захтевана од стране инвеститора (њихова употреба није уобицајена), па се групе оптерећење гр4 и гр5 не користе / Load models LM3 and LM4 have not been requested (these loads are not commonly used in practice); thus, load groups gr4 and gr5 have not been considered

Прорачунске ситуације за замор/ Fatigue design situations

Срачунати прорачунски опсег напона се упоредјује са номиналном носившћу на замор (за челик за армирање, за каблове за преднапрезање, и за бетон у притиску и при смицању) одредјену према Еврокод 2 Део 1.1 Члан 6.8.5. / Calculated design stress range is then compared with nominal fatigue resistance calculated according to Eurocode 2 Part 1.1 Article 6.8.5 (for reinforcement steel, prestressing steel, concrete compression and concrete shear)

Израз за проверу замора у челику за армирање и кабловима за преднапрезање / Expression for fatigue check for reinforcement and prestressed steel

$\gamma_{F,fat} * \Delta\sigma_{s,equ}(N^*) \leq (\Delta\sigma_{Rsk}(N^*)) / \gamma_{S,fat}$

Парцијални фактор за замор оптерећење (Evrokod 2 Part 1.1 - 2.4.2.3) / Partial factor for fatigue loads (Eurocode 2 Part 1.1 - 2.4.2.3)

$\gamma_{F,fat} = 1.0$

Парцијални фактор за материјале (Evrokod 2 Part 1.1 - 2.4.2.4) / Partial factor for materials (Eurocode 2 Part 1.1 - 2.4.2.4)

Бетон / Concrete $\gamma_{C,fat} = 1.5$

Челик за армирање и за преднапрезање / Reinforcement and prestressing steel $\gamma_{S,fat} = 1.15$

Инцидентне и сеизмицке прорацунске ситуације / Accidental and seismic design situations

Table A2.5 - Design values of actions for use in accidental and seismic combinations of actions

Design situation	Permanent actions		Prestress	Accidental or seismic action	Accompanying variable actions (**)	
	Unfavourable	Favourable			Main (if any)	Others
Accidental(*) (Eq. 6.11a/b)	$G_{k,j,sup}$	$G_{k,j,inf}$	P	A_d	$\psi_{1,1} Q_{k,1}$ or $\psi_{2,1} Q_{k,1}$	$\psi_{2,i}\ Q_{k,i}$
Seismic(***) (Eq. 6.12a/b)	$G_{k,j,sup}$	$G_{k,j,inf}$	P	$A_{Ed} = \gamma_I A_{Ek}$		$\psi_{2,i}\ Q_{k,i}$

(*) In the case of accidental design situations, the main variable action may be taken with its frequent or, as in seismic combinations of actions, its quasi-permanent values. The choice will be in the National Annex, depending on the accidental action under consideration.

(**) Variable actions are those considered in Tables A2.1 to A2.3.

(***) The National Annex or the individual project may specify particular seismic design situations. For railway bridges only one track need be loaded and load model SW/2 may be neglected.

NOTE The design values in this Table A2.5 may be changed in the National Annex. The recommended values are $\gamma = 1{,}0$ for all non seismic actions.

1 SEISMICITY OF THE TERRAIN

According to (SRPS EN 1998-2), the input parameters for seismic analysis are derived from the condition that the object, with an average service life of 50 years, does not collapse, which corresponds to seismic action with a probability of exceeding 10% over a period of 50 years. This earthquake has a return period of events of T_{NCR} = 475 years.

The second condition is that limited damage can occur only as a consequence of an earthquake, for probability which can be exceeded by up to 10% in a period of 10 years or an earthquake that has an average return period of 95 years.

To estimate the seismicity of the terrain, the map of the Republic Seismological Institute was used - the map of seismic hazard of the Republic of Serbia, which is expressed in degrees of macroseismic intensity (MCS) and the map of seismic hazard of the Republic of Serbia expressed in units of horizontal acceleration (g).

The subject location, on oleates of macroseismic intensity of earthquakes, is located in zone V-VI° MCS for a return period of 95 years, and in zone VI-VII° MCS for a return period of 475 years. The value of the horizontal acceleration of soil oscillation (a_{gr}) is 0.03g for the return period of 95 years, and 0.05g for the return period of 475 years.

According to the soil typification (SRPS EN 1998-1), the soil is characterized as a soil of "C" type - deposits of dense or medium-dense sand, gravel or solid clay (we would recommend that the soil is characterized as “E” type soil - alluvial soil with 5-20 m thickness that is characterized ether as C or D with stiffer or firmer soil underneath).

According to the typification of the category of the object (SRPS EN 1998-2), the overpass belongs to the category: bridge of class II importance.

According to Eurocode 8, the design soil acceleration a_g is represented by the product of the factor of significance of the object γ_I and the reference maximum soil acceleration a_{gr}. As the significance factor for the bridge of class II importance γ_I is 1.0, the value of the design acceleration a_g is 0.29 m/s^2 for the first condition and 0.49 m/s^2 for the second condition.

Type I elastic response spectrum is recommended, and the periods are defined in **Table 1**.

Table 1. *Values of period parameters wich describing the recommended type I elastic response spectrum*

Type of soil	S	T_B	T_C	T_D
C	1.15	0.20 s	0.60 s	2.0 s
E	1.40	0.15 s	0.50 s	2.0 s

The coefficient of seismic intensity K_s is equal to 0.025.

2.1.1 STANDARD PENETRATION TEST – SPT

The standard penetration tests were performed according to the " EN ISO 22476-3" standard, so that the penetration of the standard spoon (N) was performed with small blows of a mallet weighing 63.5 kg that fell freely from a height of 0.76 m, where the number of blows with a mallet, required for three successive 15 cm penetrations is recorded, so that the first measurement is not taken into account, and the final result N is the sum of the second and third counts with a total penetration of 30 cm.

The obtained N impact data were corrected using the models given in EN ISO 22476-3: 2005, while the relative compactions and internal friction angles were determined based on the recommendations given in SRPS EN 1997-2. **Tables 3, 4, 5, 6, 7, 8** and **9** show the results of SPT N correction in trial pits and the derived correlations with the relative compaction and internal friction angle of the isolated lithological environments.

2.1.2 CONE PENETRATION TEST - CPT

Processing of the obtained results as well as correction of the value of soil resistance to penetration of the cone qc in order to obtain the parameters of deformability and strength was performed in accordance with SRPS EN 1997-2. Coefficient α values (SRPS EN 1997-2), determined based on soil type and cone resistance qc are shown in **Table 10.**

Table 10. *Coefficient α values – Sanglerat, 1972.*

2.1.3 CHARACTERISTICS OF GEOTECHNICAL ENVIRONMENTS

Based and processing of the results of field research and testing, the engineering-geological characteristics of the selected lithological environments with the values of physical-mechanical parameters were defined in the area of the planned facility. The terrain, starting from its surface, is built by the following sediments:

Humus (h) 0.00 m - ≤0.30 m - dark brown in color, silty, with the participation of organic matter. Since the surface layer will be removed during construction, no laboratory soil tests have been performed within this layer.

Embankment (nt) 0.00 m - ≤3.00 m - dark brown in color. Since the surface layer will be removed during construction, no laboratory soil tests have been performed within this layer.

Silty clay (CIL-Cll) ≥0.20 m - ≤15.40 m - to clayey silt, yellow to brown in color. Low plastic to intermediate plastic soil, firm to very stiff consistent condition. Laboratory geomechanical testing of samples from exploration wells yielded the following values of physical and mechanical parameters of the soil (**Table 17**).

2.1.4 RELEVANT PARAMETERS OF GEOTECHNICAL ENVIRONMENTS

Descriptions of the properties of layers, their characteristics of importance for the assessment of geotechnical conditions of construction and foundation of the structure are given in the previous chapters.

It is important to notify that φ, c and M_v are adopted values, while the values of E_s and k_h are calculated on the basis of the static penetration test, more precisely on the basis of the values of the resistance of the cone q_c (values of q_c are shown in Chapter 2.1.2). On this way, the increase in the value of the coefficient of subsoil reaction per depth is shown, which is a logical process considering that the value of the cone resistance increases with increasing depth. The designer of the structure is enabled to select the value of the subsoil reaction coefficient by himself.

According to Vesić's theory from 1961., the values of the soil reaction coefficient (k_h) were determined by the soil elasticity modulus (E_s), pile diametar (d), Poisson's ratio (ν), moment of inertia (I_p) and modulus of elasticity of the pile (E_p), using folowing formulas:

$$k_h = \frac{0.65}{d} \cdot \sqrt[12]{\frac{E_s \cdot d^4}{E_p \cdot I_p}} \cdot \frac{E_s}{1 - \nu^2} \qquad \text{(Vesić, 1961.)}$$

$$M_v = E_s \cdot \frac{1 - \nu}{(1 - 2\nu) \cdot (1 + \nu)} \qquad \text{(Elasticity theory)}$$

$$I_p = \frac{r^4 \pi}{4} \qquad \text{moment of inertia of a circular pile}$$

While according to Mayerhof and Baike theory from 1963., the values of the soil reaction coefficient (k_h) were determined by the soil elasticity modulus (E_s), pile diametar (d) and Poisson's ratio (ν), using folowing formula:

$$k_h = \frac{E_s}{d \cdot (1 - \nu^2)} \qquad \text{(Mayerhof \& Baike, 1963.)}$$

The relevant soil parameters for geostatic calculations in the zones in which the pile foundation will be performed were adopted on the basis of laboratory and terrain tests and are shown in **Tables 21-32**.

Thirteen terrain models have been defined, for an individual pillar site.

3 GEOTECHNICAL CONDITIONS OF FOUNDATION OF FACILITIES

Geotechnical conditions of construction of the facility, as well as its general stability are defined on the basis of :

- geotechnical characteristics of the specified layers engaged in the foundation of the facility,
- analysis of allowable bearing capacity of soil,
- analysis of prognostic soil settlement.

In this chapter, geostatic calculations were made for thirteen terrain models for individual pillar sites 1-13, based on the results of which the impacts of objects on the ground will be considered. Input data for the calculation of bearing capacity and settlement of an individual pile as well as a group of piles were adopted on the basis of data obtained by the Investor, showed in **Table 33**.

*trials values of forces

All values of forces are preliminary and don't affect on result of bearing capacity, but serve only as data for comparison. After receiving the final values of forces, bearing capacity and settlement results will be updated.

The minimum groundwater level was adopted at a depth of 1.8 m, while the maximum groundwater level was adopted at a depth of 6.9 m from the ground surface.

3.1 DETERMINATION OF BEARING CAPACITY AND SETTLEMENT OF PILES

The analysis of bearing capacity and settlement of individual piles and groups of piles were performed on the basis of the adopted depths of foundation, dimensions of individual piles and arrangement of piles in the group. The analysis were performed with the design values of the parameters of the geotechnical section.

The calculations were performed in the Geo5 software, using the Pile group software package. Calculations were performed for design approach 2 (DA-2). For analytical type of analyze, the coefficient of efficiency of pile group is inputed automatically by software and considered at the review of results of bearing capacity of pile group. For spring type of analyze, the coefficient of efficiency of pile group is considered at the review of results of bearing capacity of single pile. In this case, analytical type of analyze is selected for pillar sites 1, 7 and 13, while spring type of analyze is selected for pillar sites 2 - 6 and 8 - 12.

The results of bearing capacity analysis obtained for the adopted terrain models for the case of foundation of an individual pile as well as on a group of piles are given in **Table 34**.

Calculations were made with the adoption of several different lengths of piles.
